Dear Hiring Team,

I joined The Students Visa as a Software Engineer Intern and, over four years, worked my way up to Senior Software Engineer — along the way architecting the multi-tenant platform infrastructure that now powers ApplyForm.io, a CRM used by education agencies and consultants worldwide, and building Counselify.ai, an AI-powered CV analysis product integrated with OpenAI and Anthropic APIs to generate study-abroad recommendations for students.

My core stack is React.js, Spring Boot, and AWS, and I've used it end-to-end: designing scalable backend systems, shipping polished React/Redux frontends, and running it all on Kubernetes and AWS (Lambda, S3, ECR). Along the way I've also worked with Next.js, Node.js, MySQL, MongoDB, and CI/CD pipelines — picking up whatever the platform needed as it grew from a single product into a multi-tenant system serving several portals.

What I enjoy most is ownership: taking a feature from architecture through to production, and being trusted to make the calls in between. I write clean, maintainable code, and I thrive in collaborative remote teams where that trust runs both ways.

I'd welcome the chance to bring that same ownership to your team.

Best regards,

Dinith Rukantha
